

Abstract

In this manual, you get an introduction in typesetting a thesis with latex and especially with the `UniLeipzigBioinfThesis` class. The core is the use of the class. However, there are also some hints and suggestions on what you should do when you write your thesis. It starts with an introductory chapter. Followed by three chapters that cover the main parts of a thesis: front matter, main text and back matter.

It is designed to fulfill the “Promotionsordnung” from the “Institut für Informatik” at the “Universität Leipzig”. The result is a class that can be used without any further tweaking and create a good looking thesis that contains all required parts. However, you can modify many of the design decisions so that you can adapt it to your flavor.

Thus, the class helps you to directly start writing and not think too much about the typesetting. I hope you enjoy this class.
